

RPlay Button

The dictation button for your Mac.

Hold it, speak, let go: your words appear where your cursor is. Press it to ask your own AI, everything on your own Mac.

Concept render, not a photo. About 50 × 30 × 7 mm, matte graphite.

Runs on your Mac

Speech to text, your lexicon and RPlay run on a latest-generation M-series Mac with 16 GB. Nothing leaves that Mac unless you say so.

No licence per user

No subscription for a dictation service and no account to keep alive. You buy the Button, install the software on your Mac, and that is it.

Open by design

Works as a plain Bluetooth keyboard without any app. Voice, buttons, light and haptics travel over an open protocol that RPlay publishes.

Concept specifications. Bluetooth LE 5, keyboard mode without an app · one microphone, powered only while a button is held, with its own LED · two tactile buttons, 6-axis motion sensor · LED ring and vibration motor · USB-C for charging and for firmware, re-installable by the user · about 50 × 30 × 7 mm, matte graphite, magnet mount and clip.

How it works

1

Hold and speak

The microphone has power only while you hold the button, and its own LED shows that it is live and listening.

2

To your Mac

Voice and button events travel over an open protocol. No cloud account, no closed app, no driver.

3

Text on the Mac

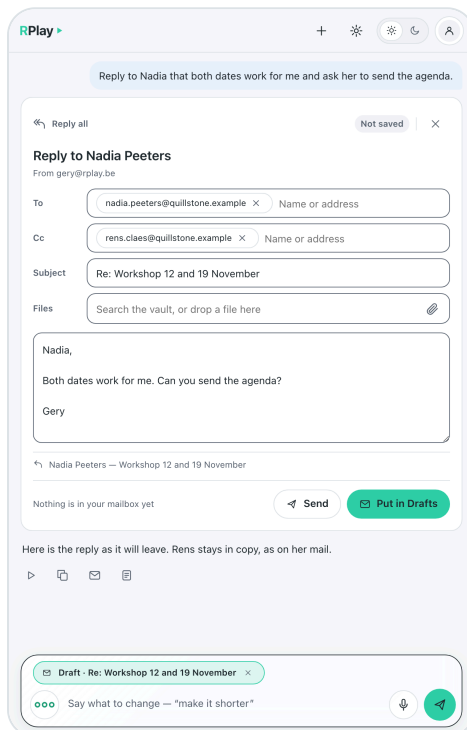

Local recognition with your lexicon: names, codes and your own terms come out right, every time you speak.

4

Dictate, or ask RPlay

The text lands where your cursor is, or RPlay answers about your own mail, your files and your calendar.

What you see on the Mac

RPlay Voice on the Mac: the dictated request, the reply as a card, Send is yours.

Who uses it

A lawyer, between two meetings

Note for the Verstraete file: the counterparty accepts the indemnity clause, capped at twelve months and limited to direct damage. Draft the confirmation to Mr. Declercq and put the file on my desk for Monday.

A doctor, after the consultation

Patient reports dyspnoea on exertion since two weeks, no chest pain, no fever, blood pressure 150 over 95. Start bisoprolol 2.5 mg once daily, blood test this week, control visit in three weeks with the results.

Anyone, with RPlay Vault

What did we agree with Salios on the site list? Reply to Joëlle that the list comes next week with the floor plans, put Rens in copy, and add a task for me for Friday morning to check the gateway count.

Names and terms come out right because they are in your lexicon. A tilt or a twist of the Button is a command too: previous, next, enter, cancel.

One Mac, three set-ups

	Dictate	Assist	Vault
The Mac	Latest-generation M-series Mac, 16 GB	Latest-generation M-series Mac, 64 GB	Latest-generation M-series Mac, 128 GB
Runs on it	Speech to text with your lexicon	Plus a local language model and spoken answers	Plus RPlay Vault (*): mail, files, calendar and business systems in one chat
For	One room, one person	A practice or an office	The whole company

(*) RPlay Vault is one Mac in your office that reads your mail, files, calendar and business systems overnight and answers in one chat during the day. Your data, your index and your keys stay with you.
